## Solar Water Heaters

Naturally heated Hot Water !!!

2 Year  
Warranty

Solar water heaters can help you save costs by reducing the amount of gas and electricity needed to heat water. By using sunlight to heat water instead of combustible sources or fossil fuel-produced electricity, fewer pollutants are being introduced into the environment. Solar energy is not affected by the current shortage of electricity and does not stop providing hot water during load shedding.

The electric heater uses 30 - 50% percent of your household's monthly electricity bill.

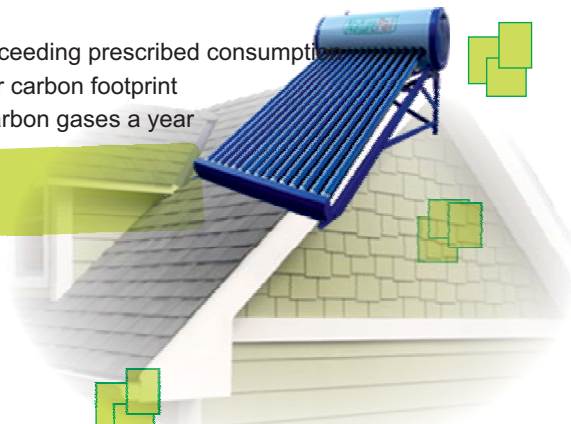

Replacing your conventional geyser with a solar powered system will reduce that

by up to 50 percent.

### Benefits of using solar water heaters

- ☆ Having hot water when others don't
  - ☆ Immediate reduction in monthly electricity bill of 30% - 50%
  - ☆ Immediate protection from future price hikes, as your geyser is the biggest consumer of energy, your solar water heater will eliminate this
  - ☆ Hot Water Supply irrespective power status
  - ☆ Reducing your risk of future penalties for exceeding prescribed consumption
  - ☆ The less energy you consume, the less your carbon footprint
- Conserving the environment - 3.7 tons of carbon gases a year
